Along: the guide that rides with you

A to B shouldn't mean forgetting everything in between

Watch trailer

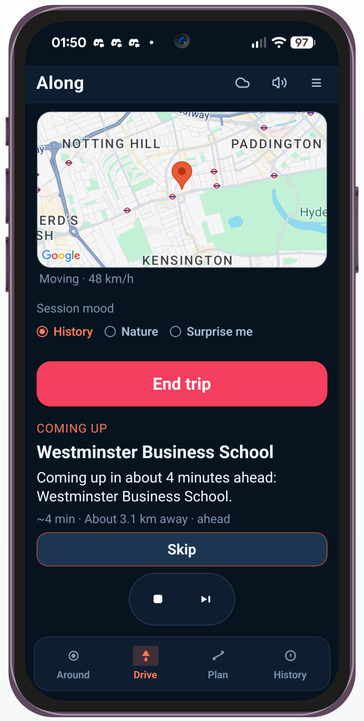

Personalized spoken stops along A→B. Maps navigates. Along narrates.

Around
"What's near me?" one-tap story

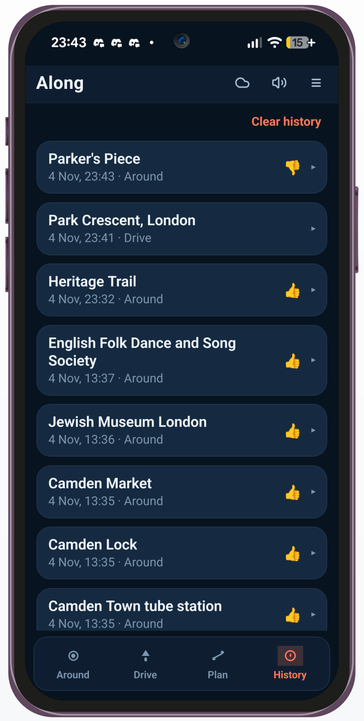

When you're walking or stopped, one tap answers "what's interesting near me?" Along finds nearby places, picks one worth your time, and speaks a short story, with optional extras listed quietly if you want more.

Drive
"Coming up" teaser before you pass it

On the move, Along looks ahead on your heading - not behind you. You get a Coming up teaser in time to decide, then the full spoken story before you've already passed. That's the stop normal navigation never pitches.

History
👍/👎 taste that personalizes the next trip

Every narration lands here. Thumbs up or down feed a taste model, so the next trip skews toward what you actually like, not a generic tourist list.

Not navigation. An ambient audio companion for driving & walking.

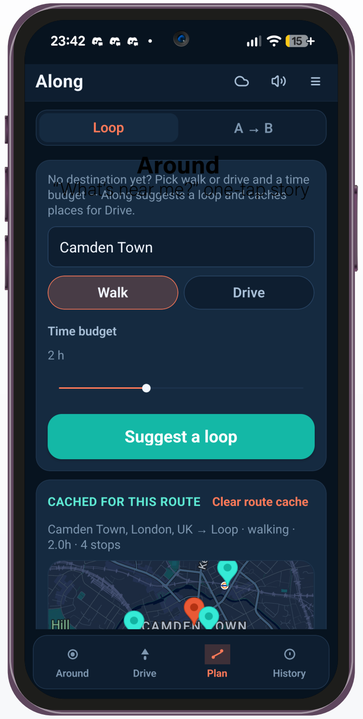

Built with:

- React Native — mobile app
- Gemini — writes spoken scripts
- sapient slingshot — orchestrates Around narration
- clef — helps pick which place
- Wikidata, Wikipedia — discover places
- Open-Meteo — weather caveats
- Google Places API — map + hours

Location / heading → **Discover POIs** (Wikipedia + OSM + Wikidata) → **Rank / decide** (taste + optional Clef) → **Write script** Gemini | OR Slingshot* → **Speak** (on-device TTS)

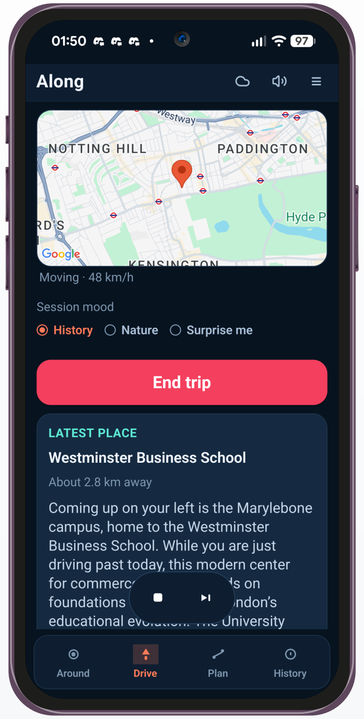

*Around can run via Sapient Slingshot: weather → pick → details → narration → package. Drive stays on the local path (latency).

Plan
browse before you move

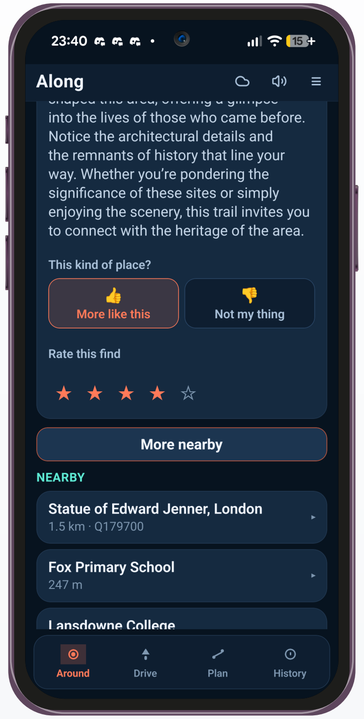

At home or on hotel Wi-Fi: suggest a timed loop, or prefetch places along A→B. Plan is browsing and caching - it feeds taste with 👍/👎, but it does not speak stories. Drive still decides what's ahead from live heading; Plan is optional fuel, not a forced stop list.

Drive
teaser → full story

After Coming up, Along can deliver the full narration while you're still approaching. Same discovery → rank → script → TTS path as Around, keyed to motion and heading so the story arrives before the missed-road moment.

Around
mood + spoken word

Session mood (History / Nature / Surprise) steers what "interesting" means right now. This is also the path that can call Slingshot instead of the local Gemini-only write step - same app UI, orchestrated backend.

Plan ≠ commitment to drive · Drive ≠ Plan queue · Around ≠ Drive

sapient slingshot
